I. INTRODUCTION

Diophantine equation of the form \( y^2 = Dx^2 + 1 \), where D is a given positive square-free integer is known as pell equation and is one of the oldest Diophantine equation that has interesting mathematicians all over the world, since antiquity. J.L. Lagrange proved that the positive pell equation \( y^2 = Dx^2 + 1 \) has infinitely many distinct integer solutions whereas the negative pell equation \( y^2 = Dx^2 - 1 \) does not always have a solution. In [1], an elementary proof of a criterion for the solvability of the pell equation \( x^2 - Dy^2 = -1 \) where D is any positive non-square integer has been presented. For examples the equations \( y^2 = 3x^2 - 1 \), \( y^2 = 7x^2 - 4 \) have no integer solution whereas \( y^2 = 54x^2 - 1 \), \( y^2 = 202x^2 - 1 \) have integer solutions. In this context, one may refer [2-17]. More specifically, one may refer “The on-line encyclopedia of integer sequences” (A031396, A130226, A031398) for values of D for which the negative pell equation \( y^2 = Dx^2 - 1 \) is solvable or not.

In this communication, the negative pell equation \( y^2 = 112x^2 - 7 \) is considered and infinitely many integer solutions are obtained. A few interesting relations among the solutions are presented.

II. METHOD OF ANALYSIS

The negative pell equation representing hyperbola under consideration is

\[ y^2 = 112x^2 - 7 \]  \( (1) \)
whose smallest positive integer solution is

\[ x_0 = 2, \quad y_0 = 21 \]  \( (2) \)

To obtain the other solutions of \( (1) \), consider the pell equation

\[ y^2 = 112x^2 + 1 \]  \( (3) \)

whose general solution is given by

\[ \tilde{y}_n = \frac{f_n}{2} \]
\[ \tilde{x}_n = \frac{g_n}{2\sqrt{112}} \]
\[ f_n = (127 + 12\sqrt{112})^{n+1} + (127 - 12\sqrt{112})^{n+1} \]
\[ g_n = (127 + 12\sqrt{112})^{n+1} - (127 - 12\sqrt{112})^{n+1}, \quad n = 0, 1, 2, 3, \ldots \]

Applying Brahmagupta lemma between \( (x_0, y_0) \) and \( (\tilde{x}_n, \tilde{y}_n) \), the other integer solutions of \( (1) \) are given by

\[ x_{n+1} = f_n + \frac{21}{2\sqrt{112}} g_n \]  \( (4) \)
\[ y_{n+1} = \frac{21}{2} f_n + \sqrt{112} g_n \]  \( (5) \)

The recurrence relations satisfied by \( x \) and \( y \) are given by

\[ x_{n+3} - 254x_{n+2} + x_{n+1} = 0 \]
\[ y_{n+3} - 254y_{n+2} + y_{n+1} = 0, \quad n = -1, 0, 1, 2, \ldots \]

Some numerical examples of \( x \) and \( y \) satisfying \( (1) \) are given in the table below:

From the above table, we observe some interesting relations among the solutions which are presented below:

1. \( x_n \) is always even
2. \( y_n \) is always odd
3. Relations among the solutions:

\[ 9408x_{n+2} = 7y_{n+3} \]
\[ -889y_{n+2} \]
On The Negative Pell Equation \( y^2 = 112x^2 - 7 \)

1. \( y_{n+1} = 254y_{n+2} - y_{n+3} \)

2. \( 341376x_{n+1} = y_{n+3} - 32257y_{n+1} \)

3. \( 225799x_{n+1} = 7x_{n+3} - 21336y_{n+1} \)

4. \( 889y_{n+1} = 225799x_{n+2} - 9408x_{n+3} \)

5. \( 225799x_{n+2} = 889x_{n+3} - 84y_{n+1} \)

6. \( x_{n+1} = x_{n+3} - 24y_{n+2} \)

7. \( 889x_{n+2} = 7x_{n+3} - 84y_{n+2} \)

8. \( y_{n+3} = 254y_{n+2} - y_{n+1} \)

10. \( 254y_{n+2} = y_{n+1} + y_{n+3} \)

11. \( 341376x_{n+3} = 32257y_{n+3} - 4y_{n+1} \)

12. \( 1344x_{n+2} = 127y_{n+2} - y_{n+1} \)

13. \( 341376x_{n+2} = 127(y_{n+3} - y_{n+1}) \)

\[

is a cubical integer.

IV. CONCLUSION

In this paper, we have presented infinitely many integer solutions for the hyperbola represented by the negative Pell equation \(y^2 = 112x^2 - 7\). As the binary quadratic Diophantine equation are rich in variety, one may search for the other choices of negative Pell equations and determine their integer solutions along with suitable properties.
